

3HFM / HyHEL-10-lysozyme: learned $\Delta\Delta G$ versus simulation signals

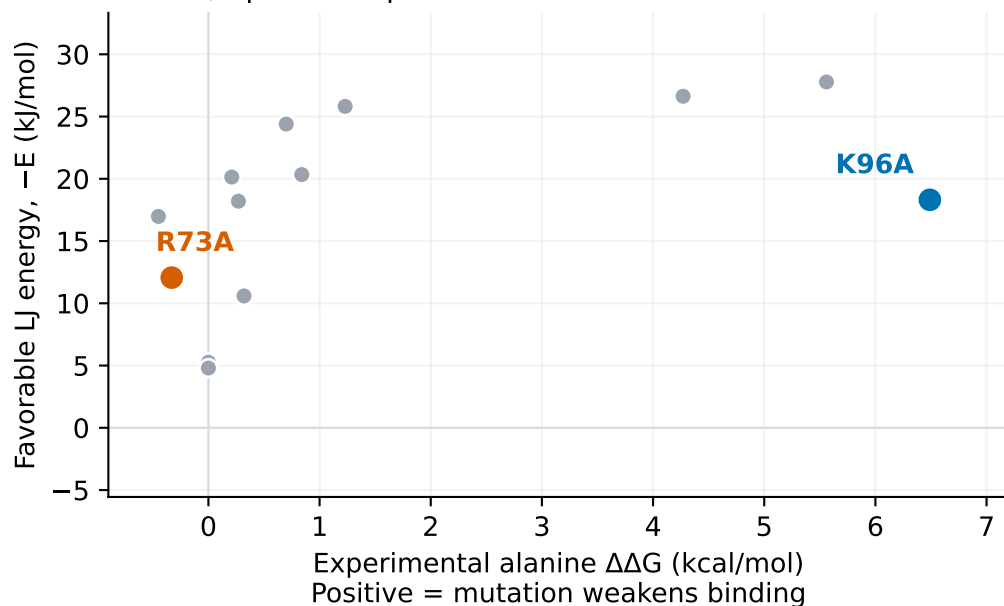

StaB-ddG · two single mutants
n = 2; selected diagnostic pair

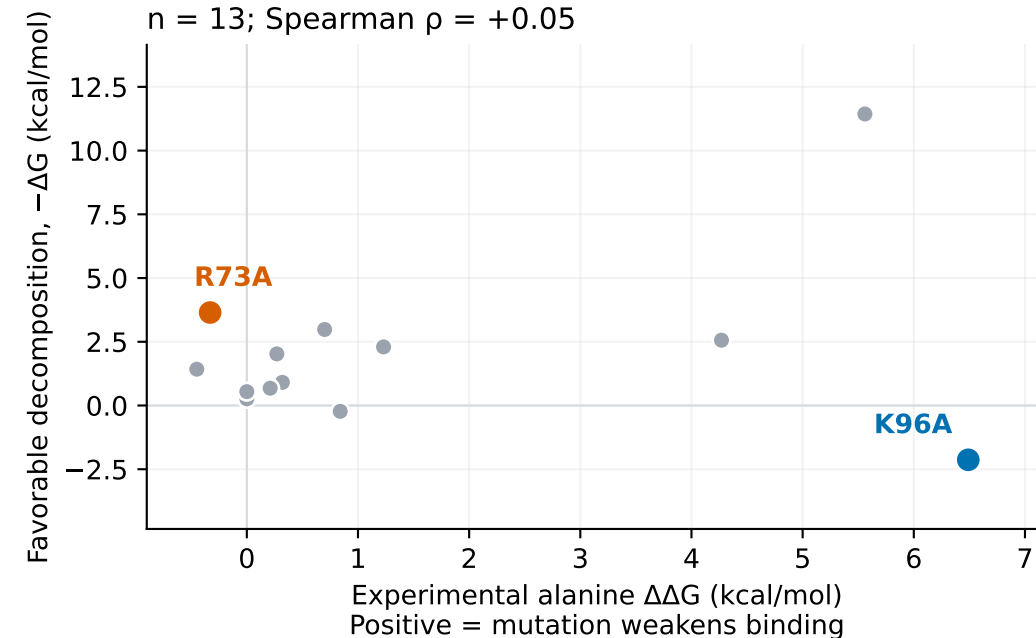

Raw interaction energy · 201 frames
n = 13; Spearman $\rho = +0.46$

Lennard-Jones only · 201 frames
n = 13; Spearman $\rho = +0.73$

MM-GBSA · 20 frames
n = 13; Spearman $\rho = +0.05$

Blue: K96A Orange: R73A Gray: other measured antigen residues
Simulation panels show sign-flipped wild-type energy contributions, not predicted mutation $\Delta\Delta G$.
Only two mutations have ML predictions; training overlap has not been established.
